TITLE: A New Method of Protecting Components From Corrosion

PERIODICAL: Mashinostroitel', 1960, No. 12, p. 35

TEXT: A new method of protecting steel parts from corrosion has been used for half a year at one of the Mosoblssovarkhoz enterprises. The parts are treated with an anticorrosion solution composed of 10 g/liter triethanolamine, 50 g/liter sodium nitrite and 1 liter distilled water. The prepared solution is analyzed in the chemical laboratory as to specific gravity, sodium nitrite content and corrosion on steel plates. If the sodium nitrite content is too low, more has to be added until the necessary concentration is attained. In this case triethanolamine has to be added in proportion to the added sodium nitrite quantity. The corrected solution is rechecked in the laboratory. The component machined is held in the anticorrosion solution at room temperature for 30 seconds. After being removed from the solution the surplus of solution has to flow off from the component, which is then put on a rack or packed. Components treated in this way can be stored for 2-3 months. ✓

"Investigation of Occupational Exposures to Ionizing Radiation in Czechoslovakia."

Prague, Pracovni Lekarstvi, Vol 18, No 5, Jun 66, pp 211 - 219

Abstract /Authors' English summary modified/7: The organization of film dosimetry is described; the films are carried in a special badge. The reading is exact to within  $\pm$  20%. Exposures exceeding 400 mr are reported to the Institute for Radiation Hygiene. In 1964, 3191 workers were controlled; this was about one-third of the total work force employed in areas exposed to radiation. 82.4% of the workers received less than 1/10th of the permissible radiation. Only 7 people (0.22%) received a dose exceeding the permissible value. 4 Figures, 3 Tables, 3 Western, 1 Czech, 1 East German reference. (Manuscript received 21 Jul 65).

("Práce ústavu radiotechn. a elektron.", 1961, no. 20, 32 pp,  
English; Russian, French, German and Czech summaries)

TEXT: The probability distributions of amplitude and phase of the coefficient of depolarization of a plane electromagnetic wave scattered by a set of randomly arranged bodies are calculated. It is assumed that the diagrams of scattering by each body are known, and interaction among the scattering bodies is neglected. The scattering bodies occupy a finite volume, and the observation point is remote. The total scattered field is determined by superposition of the fields scattered from each body. The components of this sum are the random complex vectors, whose amplitudes and phases depend on the random position, the shape, the reflecting properties, and the orientation of the scattering bodies. It is supposed that the conditions of the problem on hand satisfy the central limit

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 6, 1962, abstract 6-7-134 n (Práce ústavu radio-techn. a elektron., no. 20, 1961, 32 pages)

TEXT: The reflection, refraction and diffraction of an electromagnetic wave is nearly always accompanied by changes in its polarization. The determination is considered of the distribution function of the polarization factor of a plane electromagnetic wave scattered by a system of bodies with random spacing or random orientation. The distribution function is calculated as the sum of N vectors with random amplitudes and phases, representative of the waves reflected from all elements of the system. It is assumed, to make matters simpler, that the scattering functions of a single body and the spacing or orientation functions are known. Multiple scattering is disregarded. Examples of the use of the method are given. 15 re-

techn. a elektron., no. 21, 1961, 13 pages)

TEXT: The article considers the influence of the depolarization  
effect of a wave incident on bodies of various dimensions on the  
effective radar scattering cross-section. A series of practical con-  
clusions are derived from the vector analysis given. The depoli-  
rization effect of the incident wave must be taken into account when  
the dimensions of the reflecting body are smaller than a wavelength.  
The effective scattering cross-section of the reflecting body de-  
pends on the polarization of the incident wave and can become equal  
to zero. The depolarization effect can be disregarded for  $kA \geq 4$   
where  $A$  is the characteristic linear dimension of the body and  $k =$   
 $= 2\pi/\lambda$ . 6 references. Czechoslovak Academy. [Abstracter's note:

TITLE: Polarization-dependent scattering cross-sections

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika,  
no. 5, 1962, 24, abstract 5zh182 (Práce ústavu radio-  
tekhn. a elektron., 1961, no. 21)

TEXT: The effect of the depolarizing action of the scatterer on the value of its effective reflecting surface is examined. It is assumed that the scatterer has at least two axes of symmetry, the observation point being in distant scattering zone. The dependence between the magnitude of the effective reflecting surface and depolarization coefficient during scattering is calculated. The results show that, in determining the radio-location scattering cross-section, the depolarization effect can be neglected if the radii of curvature of the surface of the scatterer, or the distances between its scattering edges  $> 2\lambda/\pi$ , ( $\lambda$  - wavelength of the incident field). TITLE: The scattering of arbitrarily polarized e-m waves  
on an arbitrarily oriented subcritical meteor trail

PERIODICAL: Slaboproudý obzor, v. 24, no. 4, 1963, 214 - 218

TEXT: The article examines the scattering of e-m waves from an ionized cylinder for the purpose of determining the amplitudes of a signal received simultaneously by horizontal and vertical antennas for an arbitrarily linear polarized transmitted signal. The appearance of a component polarized at right-angles to the transmitted signal is only possible if the point of reflection from the trail is not in the plane perpendicular to the Earth's surface. The fading of the signal in time is identical for the two components. The expressions are obtained on the assumption that there is no interaction among the electrons in the trail. The results are in good agreement with observations on subcritical meteor trails of arbitrary orientation. There are 3 figures.

SOURCE: Studia geophysica et geodaetica, no. 3, 1964, 268-273

TOPIC TAGS: meteor trail, echo signal, exponential formula, meteor occurrence, Poisson distribution, phase distribution, instantaneous amplitude, amplitude distribution

ABSTRACT: Strong isolated meteor trails determine the distribution of large echo signal amplitudes, while the distribution for weak decaying signals asymptotically approaches the Rayleigh formula. A system of echo signals forms a sequence of exponentially decreasing amplitudes which are characterized by an exponential formula. The frequency of meteor occurrence is expressed for a chosen time interval by the Poisson distribution. The mean square amplitude is determined for the case of uniform phase distribution of echoes. The measured amplitude represents a sum of instantaneous amplitudes which may be

SOURCE: Slaboproudý obzor, v. 26, no. 2, 1965, 99-107

TOPIC TAGS: electromagnetic field, depolarization, electromagnetic wave interference

Abstract (Author's Czech, Russian and English summaries, modified): The article the essentials of the theory of wave interference applied to the research of chaotic electromagnetic fields in built-up spaces. Field amplitudes were measured at 56.25 Mc in various parts of Prague which were classified according to the character of the surrounding buildings. The results are processed statistically to determine the influence of the kind of buildings on the amplitude and depolarization and to judge the agreement between the experimental and theoretical distribution curves known until now. Orig. art. has 8 tables, 14 formulas, and 8 graphs. [JPRS]

Relation between the excretion of 17-keto steroids and organic sulfur. Josef Charvat, Michal Kandák, and Prantišek Chytil (Charles Univ., Prague, Czech.). *Casopis Lékařů Českých* 90, 107-0(1951)(English summary).—A study was made of the excretion of 17-keto steroids (17-KS) in 24 patients of various age, sex, diet, and disease. Various fractions of S were detd. (total, total sulfates, etheral sulfates, and org. S). Daily output of 17-KS varied between 0.8 and 73.2 mg. The results indicate that there is correlation between 17-KS and org. S. Conjugation with cysteine (cf. Liebermann et al., *C.A.* 41, 1745; 43, 5087a) might be one explanation of the observation. —B. J.

1. Of the Institute of Diseases of Blood Circulation, Prague-Krc,  
the Second and Third Internal Clinics of Charles University, and the  
Institute of Nutrition, Prague.

CHYTIL, F.

Mechanism of the change of the renal threshold for glucose during the course of diabetes mellitus. L. Brnd, M. Chytil, P. Chytil, R. Kotianová, M. Válková, and J. Hlaváčková (Praha Univ., Prague, Czech.). *Casopis Lékařů Českých* 92, 481-91 (1953).—The mechanism of glucose (I) excretion was studied in 16 persons, 14-67 yrs. old, who had suffered from diabetes mellitus from 1 to 24 years; 10 showed complications such as proteinuria and hypertension. Glutathione was used, according to Blin-Weller (*C.A.* 29, 6813). The results are presented in numerous tables which can be summarized as follows: the min. threshold for I was increased in 12 subjects, the av. threshold was above normal in 4, and in the upper normal range in 5 subjects. The threshold changed even if the individual had suffered from diabetes for a short time only, and had no relation to nephrosclerosis or intercapillary glomerulosclerosis, if present. Thus, the increase of the threshold presumably is due to an increased tubular reabsorption of I. I cannot be reabsorbed by activation of new nephrons, as shown on studies of nondiabetic individuals with kidney diseases. As the plasma I and the I reabsorption change suddenly, there can be no passive back-diffusion of I from concd. tubular urine into the blood. The absorbing zone for I spreads to the whole proximal tubule; there is no correlation between I reabsorption and the activity of the adrenal cortex. The speed of change suggests a reflex mechanism.

Increase of glycogenolysis in rats traumatized by the injection of terebenthine. L. Chytil (Acad. Tchecoslovaque Sci., Prague). *J. physici. (Paris)* 48, 460-5 (1956).—Rats were traumatized by the injection of terebenthine, and liver glycogen and blood-glucose levels detd. periodically in the following 24 hrs. In the first 90 min. following traumatization, liver glycogen rapidly decreased but returned to pretrauma levels in the following 90 min.; thereafter it again declined rapidly until 6 hrs. post-trauma and then decreased slowly thereafter. In the treated rats blood-glucose concns. rose as liver glycogen concns. decreased. Evidence is presented indicating that the increased glycogenolysis is not the result of increased peripheral utilization of glucose or increased hepatic phosphorylation resulting from release of adrenaline following trauma, or increased phosphatase activity, or of increased serum-amylase activity. The author concludes some factor other than adrenaline exists in the mechanism whereby hepatic glycogen is mobilized following trauma. F. A. Smith

Title : Basic Experimental Premises for the Influence on Hypoxia  
of the Liver by Means of Intra-Intestinal Insufflation  
of Oxygen.

Orig Pub : Casop. lekaru ceskych, 1957, 96, No 40-41, 1278-1282.

Abstract : During insufflation into the digestive tract of air or  $O_2$ ,  
the absorption of  $O_2$  in the small and large intestine  
of rat is very gradual, reaching 0.44 ml of  $O_2$  in minute.  
This quantity is sufficient for the normal supply of the  
liver, even during compression of the hepatic artery.

/ Effect of aeration of the small intestine on the oxyhemoglobin content of portal blood. O. Poupa, M. Kopecky, and F. Chytil (Czech Acad. Sci., Prague). Nature 179, 600-603 (1957). Adult male Wistar rats were anesthetized (Thiopentone 0.2 ml./100 g. body wt.), and after laparotomy blood samples were taken from the portal vein by glass micropipet. The wall of the gut was punctured and 10 ml. of gas insufflated. O<sub>2</sub> was detd. by modified microvan Slyke and bromoglobin by the spectroscopic method of Heidinger and Mutius. Insufflation with O<sub>2</sub> or air increased the oxyhemoglobin content of the portal blood. The amt. of O<sub>2</sub> washed out from the lumen of the intestine was about twice as great with pure O<sub>2</sub> as with air insufflation. No N<sub>2</sub> was washed out in the exptl. period and the second and transitory rise in O<sub>2</sub> of the portal blood after N<sub>2</sub> was regarded as due to opening of the arterio-venous channels in the wall of the gut. Sixty min. after insufflation of O<sub>2</sub> there was a 200% increase in glycogen content of the liver as compared with anesthetized laparotomized controls.

1565. POSTTRAUMATIC AMINOACIDAEMIA - Chytík F. and Hruža Z. Lab. of the Physiol. and Pathophysiol. of Metab., Czechoslovak Acad. of Scis. Prague - PHYSIOL. BOHEM. 1958, 7/5 (417-423) Graphs 1 Tables 3

Changes of the amino-acid and urea levels were studied in the blood of rats traumatized in a Noble-Collip drum. Immediately after traumatization, a sharp increase occurred in the blood amino-acid level; this later fell below the initial level, before finally returning to normal. Changes in the blood urea followed a different course. Haemoconcentration plays only a minor part in the sharp posttraumatic increase in the blood amino-acids. The source of the increased amino-acids is not the 'reserve protein', since hyperaminoacidaemia was also found in animals which had been fed for a considerable period on a low-protein diet. Hyperaminoacid-aemia also occurred in adrenalectomized rats subjected to traumatization; post-traumatic hyperglycaemia was not observed in these animals. (II, 9\*)

CHYTL, M. "Rice diet v. diet without hypertension" in: Rice diet in the treatment of hypertension CAS. LÉK. ČES. 1953, 22/30-31 (350-356) Tatras 1 (5109)

The effect of a rice diet was studied in 6 patients suffering from hypertension. The diet is monotonous and its use over a longer period is badly tolerated. The changes obtained by a rice diet especially in the blood pressure, eye fields and electrocardiograms were almost the same as those after a standard salt-free diet. In 2 patients, after a rice diet followed over a long period, a markedly depressing effect on renal function was observed. Pojár-Brno

Mechanism of modifications of the renal threshold for glucose in diabetes mellitus. Cas. lek. cesk. 92 no. 18:281-291 1 May 1953. (CIML 24:5)

1. Of the Institute of Diseases of Blood Circulation, Prague-Krc,  
the Second and Third Internal Clinics of Charles University, and the  
Institute of Nutrition, Prague.

Mechanism of the change of the renal threshold for glucose during the course of diabetes mellitus. L. Brod, M. Chytil, P. Chytil, B. Kolárová, M. Válková, and J. Hlaváčková (Karla Univ., Prague, Czech.). *Casopis Lékařů Českých* 92, 381-91 (1953).—The mechanism of glucose (I) excretion was studied in 18 persons, 14-67 yrs. old, who had suffered from diabetes mellitus from 1 to 24 years; 10 showed complications such as proteinuria and hypertension. Glutathione was detd. according to Blaet-Weller (*C.A.* 29, #0134). The results are presented in numerous tables which can be summarized as follows: the min. threshold for I was increased in 12 subjects, the av. threshold was above normal in 3, and in the upper normal range in 5 subjects. The threshold changed even if the individual had suffered from diabetes for a short time only, and had no relation to nephrosclerosis or intercapillary glomerulosclerosis, if present. Thus, the increase of the threshold presumably is due to an increased tubular reabsorption of I. I cannot be reabsorbed by activation of new nephrons, as shown on studies of nondiabetic individuals with kidney diseases. As the plasma I and the I reabsorption change suddenly, there can be no passive back-diffusion of I from concd. tubular urine into the blood. The absorbing zone for I spreads to the whole proximal tubule; there is no correlation between I reabsorption and the activity of the adrenal cortex. The speed of change suggests a reflex mechanism.

*Glycosuria, Mirko*

The mechanism of glucose excretion in renal diabetes.  
Jan Brod, Mirko Chytil, Evzenie Kotanová, and Marie  
Válková. *Citopatologický Časopis* 93, 18-23 (1954).—Four  
subjects were studied. With the exception of glycosuria  
their urine contained no abnormal ingredients and their  
rates of glomerular filtration and renal blood flow were  
normal. Two showed diminished min. glucose threshold  
without parallel reduction of the mean glucose threshold;  
the other 2 had depressed thresholds. Max. tubular re-  
absorption of glucose was normal in 1, just below the lower  
limit of normal in another, and subnormal in 2. Tubular  
secretion of *p*-aminohippuric acid was diminished in all 4.  
In 1, urine contained all the filtered glucose (by the Somogyi  
and anthrone method) at normal plasma levels. Hence, all  
the renal tubules were impotent. When the plasma glu-  
cose level rose to high levels, the tubular cells suddenly re-  
gained their lost reabsorption ability for glucose. The pres-  
ence of impotent nephrons should, therefore, be suspected in  
all renal diabetics with permanent glycosuria, even at the  
lowest observed plasma levels. On the other hand, in those  
subjects where glycosuria is encountered only when plasma  
glucose starts to rise, a disturbed balance between a normal  
glomerular glucose load and a diminished tubular ability to  
reabsorb glucose is present. This imbalance can occur  
only in individual nephrons or it can be generalized.

Title : Renal Circulation Disorders in Hypertensive Disease.  
Orig Pub : Univ. carolina. Med., 1955, Suppl. No 1, 127-133

Abstract : In cases of predisposition to hypertension, the renal blood circulation (RC) is decreased to 90% of the normal value, and the glomerular filtration (GF) as well as the "fil'tratsionnaya fraktsiya" [filtrated fraction] (FF) are increased. In cases of hypertension, RC is down to 59%, GF is also decreased, and FF is increased. In cases of malignant hypertension, RC is lowered down to 34%, GF goes down and FF goes up. Physical effort and emotional factors lower RC, and increase FF as well as the resistance of the renal vessels (RV).

Blocking of sympathetic ganglia with methonium lowers RV. There are changes in the afferent and the efferent glomerular vessels; they are more pronounced in the afferent ones - which coincides with anatomical data (hyaline changes in the afferent vessels and the glomeruli). The mentioned changes and the increased resistance of the afferent and the efferent vessels, as well as the increased blood pressure in the glomeruli are among the causes of the development of nephrosclerosis in hypertension.
